Natural Resources
Canada

Canada 

Scientific and societal drivers

- **Integrating surface water and groundwater**
water budgets: reporting units are 'surface water basin' + 'groundwater body'

increase in regulations to develop water budgets

~25% of Canadian rely on groundwater (StatsCan 2010)

(Gauthier, 2009, Conservation Ontario)

Technologic drivers

- **SDI: a promising approach to deliver data for water budgeting**

numerous distributed, heterogeneous data sources

emerging, competing water data standards, e.g. 'groundwater body'

GML Application Schema
<API Specification/>

Overview Package Class Help

GML Application Schema - Package Overview

Package Name	Package Description
GWML	Root package for GWML v 1.1 GWML (GroundWater Markup Language) an application schema used in the groundwater domain.

Semantic heterogeneity

▪ what's a 'groundwater body'

specific amount of **matter** or the **object** composed of the matter?

- e.g. water body of the Ogallala aquifer is a timeless object but its water matter (slowly) changes over time
- water quality issue: the matter travels, object is fixed
- water quantity issue: the matter disappears (dry river), object persists

fills a **void**?

- water quantity and quality issue: size and connection of voids constrains quantity and flow

INSPIRE

object or matter?

no voids

GWML

object

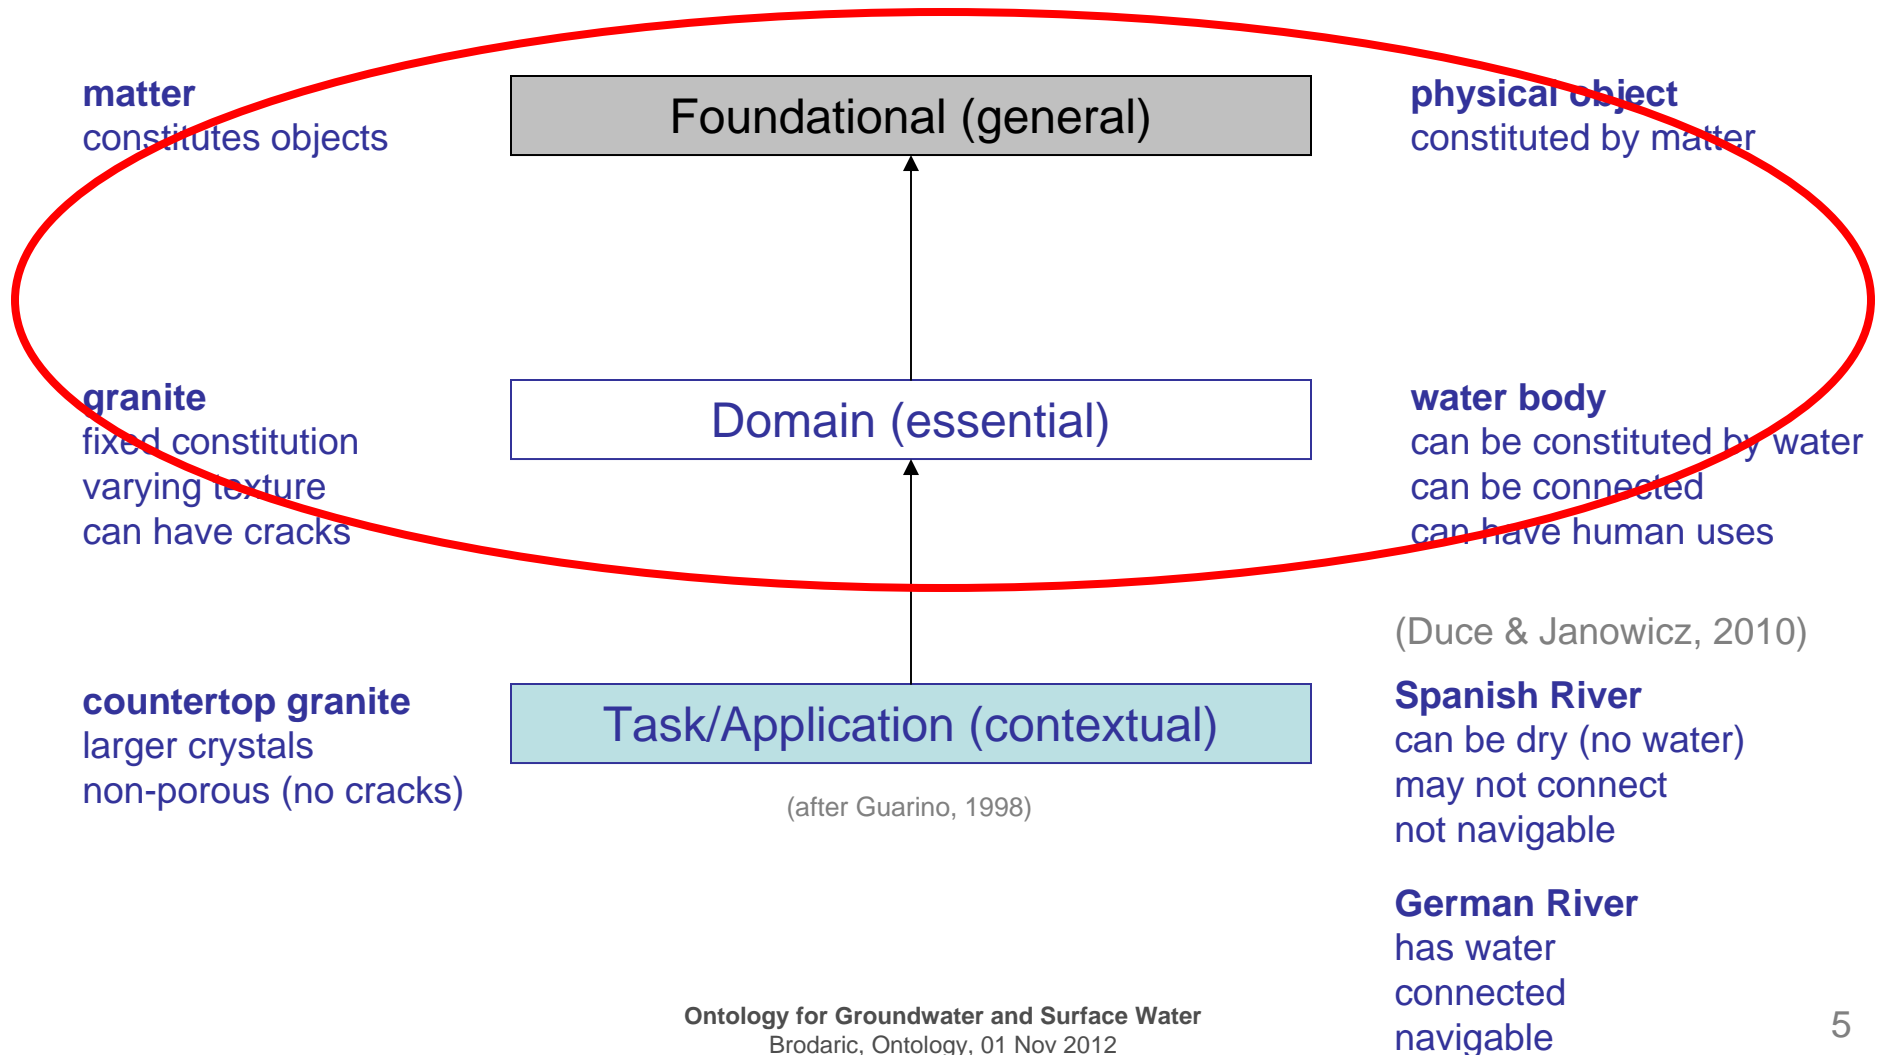

object fills voids

▪ use reference concepts for disambiguation

Types of reference ontologies

- **science ontologies: non-contextual focus**

Inland Water Ontologies... many

- **Surface Water Features**
 - lake vs pond, river vs stream? UK Ordnance Survey
(Santos et al. 2005; Hart et al. 2007)
- **Measured Properties**
 - stream flow, level, arsenic, evapotranspiration: CUAHSI
(Bermudez & Piasecki, 2003; Beran & Piasecki, 2009; Privesetev et al.)
- **Events and Processes**
 - floods, flow: 'water falls but waterfall doesn't' (Galton & Mizoguchi, 2009)
- **Hydrogeology**
 - aquifer, groundwater body, well: SWEET
(Tripathi & Babaie, 2008; Brodaric & Probst 2009)
- **Schema: Surface and Subsurface**
 - OGC WaterML, GWML, HydroFeatures; INSPIRE GE

Elements of essential hydro ontology

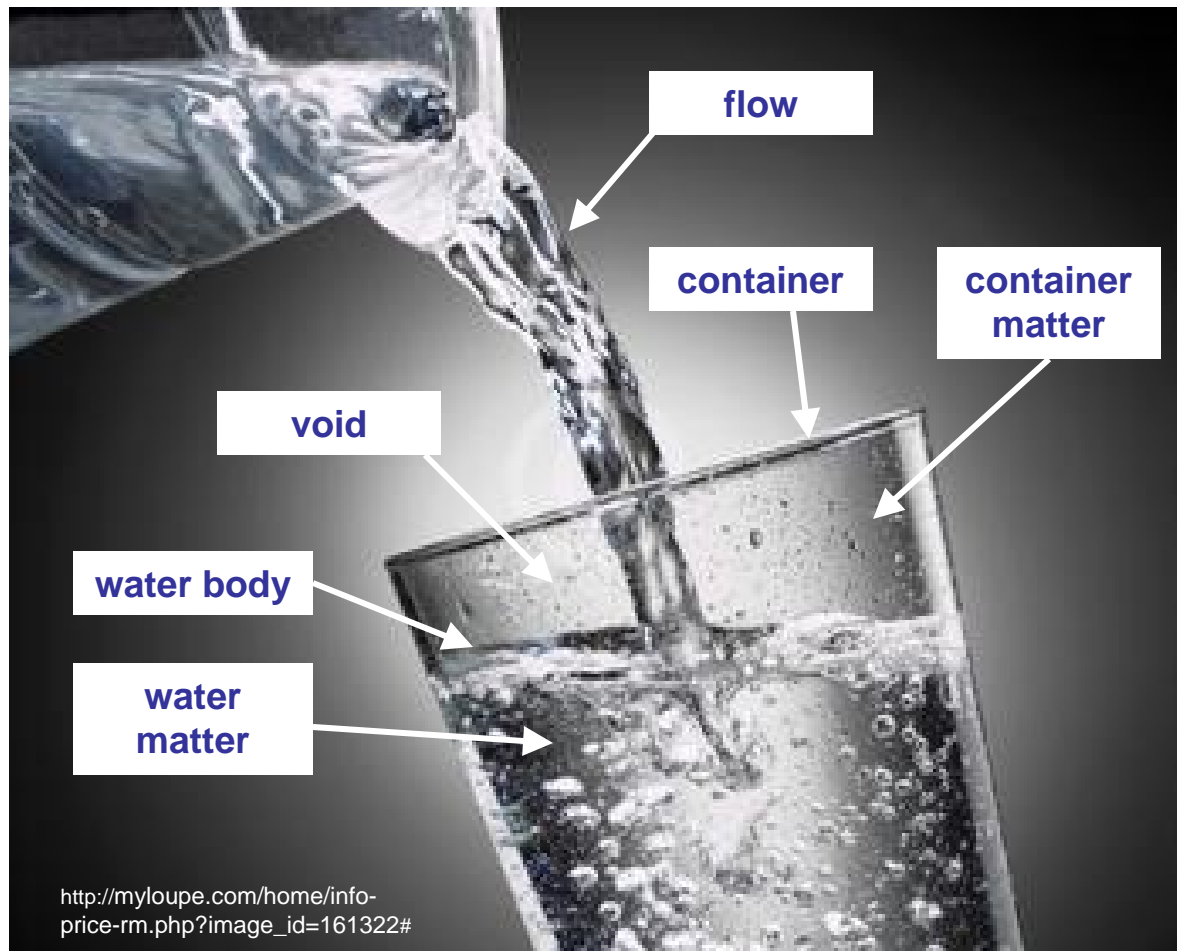

- **contrast concepts:** different natural situations for gw & sw
- **boundary concepts:** bridge between gw & sw, e.g. flow
- **common concepts:** shared container concepts for gw & sw

Essential common concepts

- container schema for water

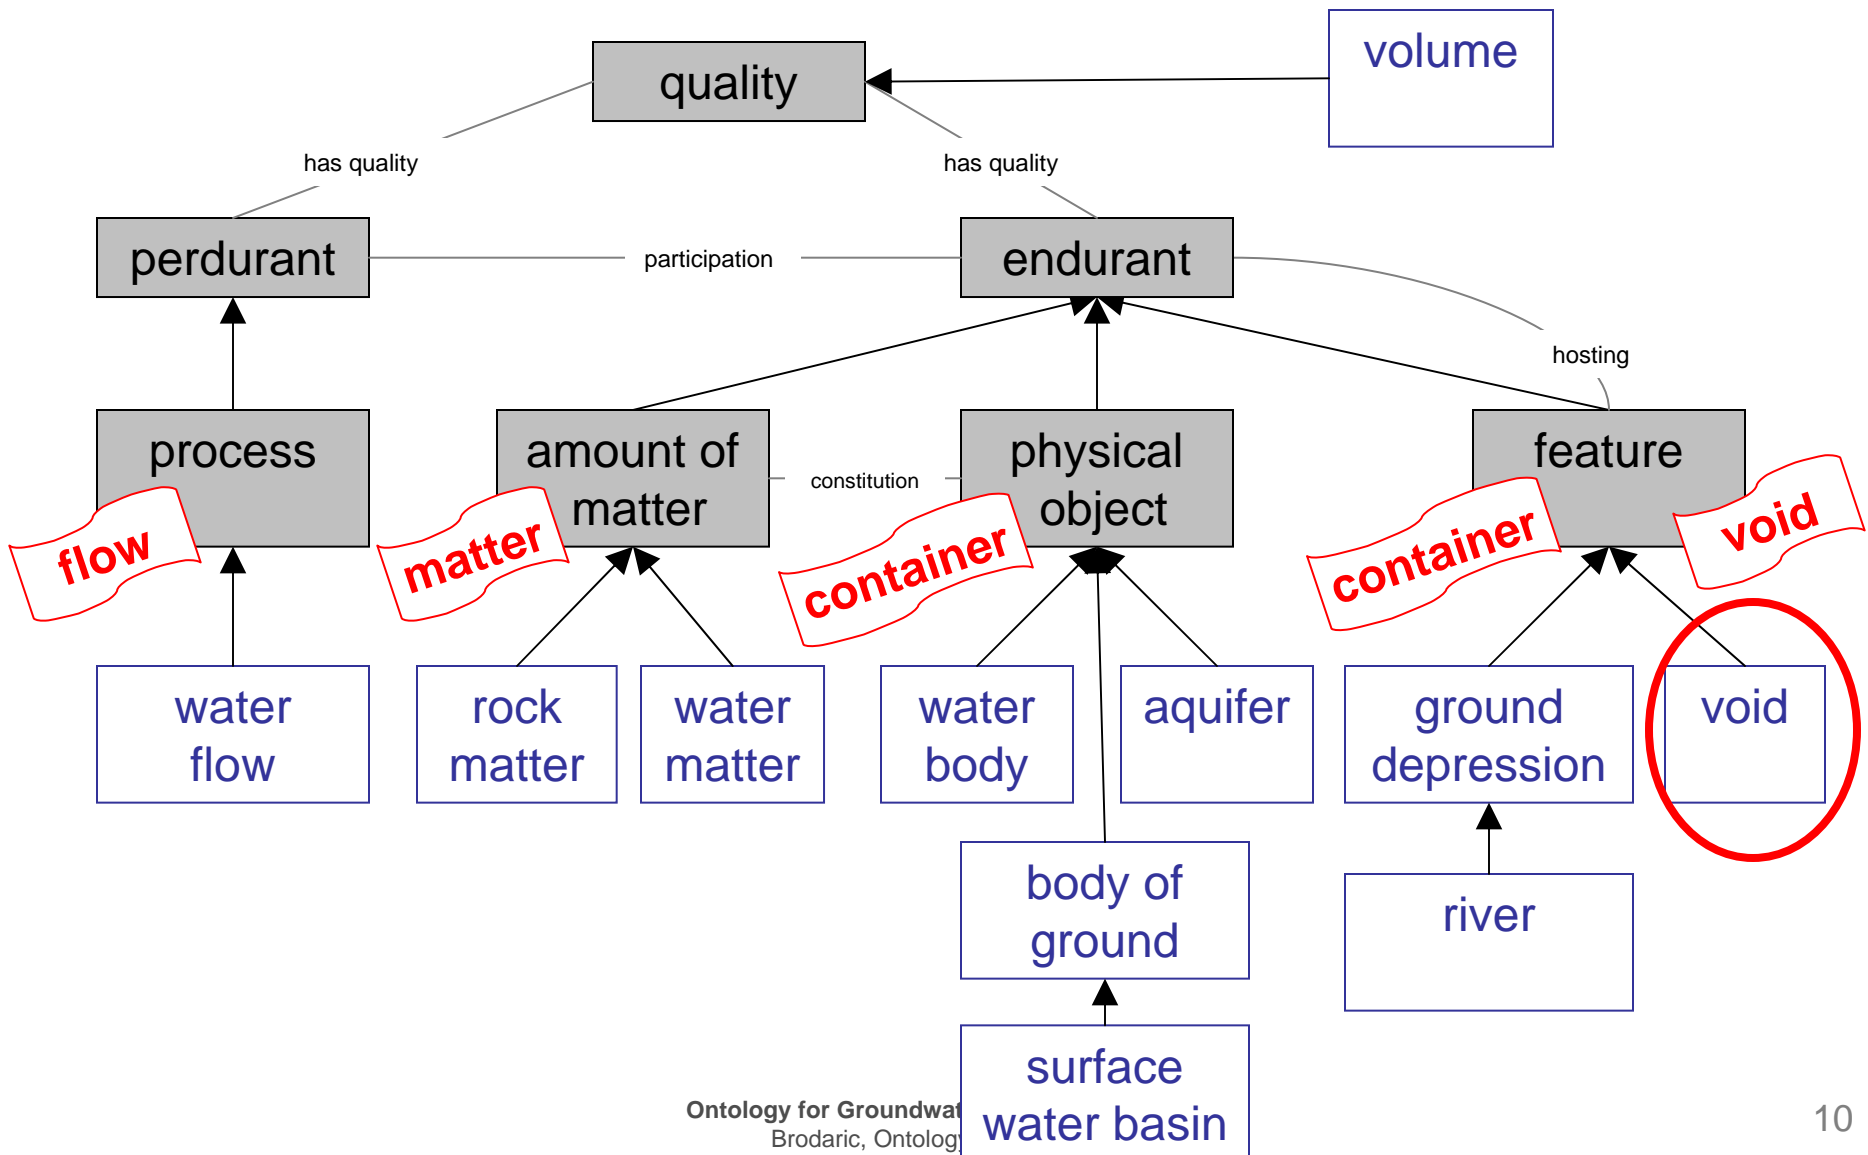

Essential common concepts

- applied to surface water and groundwater

DOLCE: boundary, shared, contrast concepts

Voids

- **holes** (Casati & Varzi, 1994)
depressions, cavities, tunnels
formal logical theory (FOL)
no gaps: suitable for surface water but not groundwater

Voids

- **gaps** (Hahmann & Brodaric, 2012)
depressions, cavities, tunnels
formal logical theory (FOL)
suitable for ontology of pores in rocks

cavity

depression

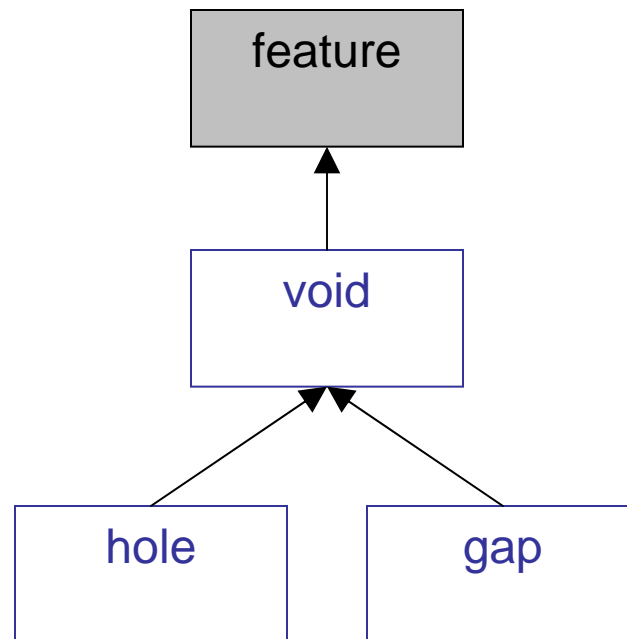

tunnel

Voids

- **voids: generalize holes and gaps**

need containment relations with voids (*'inside a hole'*)

(V9) $hosts-h(x, y) \equiv hosts-v(x, y) \wedge ICon(x)$

(non-scattered host of a void)

(Hole-D) $Hole(y) \equiv \exists x[hosts-h(x, y)]$

(hole has a non-scattered host)

(V10) $hosts-g(x, y) \equiv hosts-v(x, y) \wedge \neg ICon(x)$

(scattered host of a void)

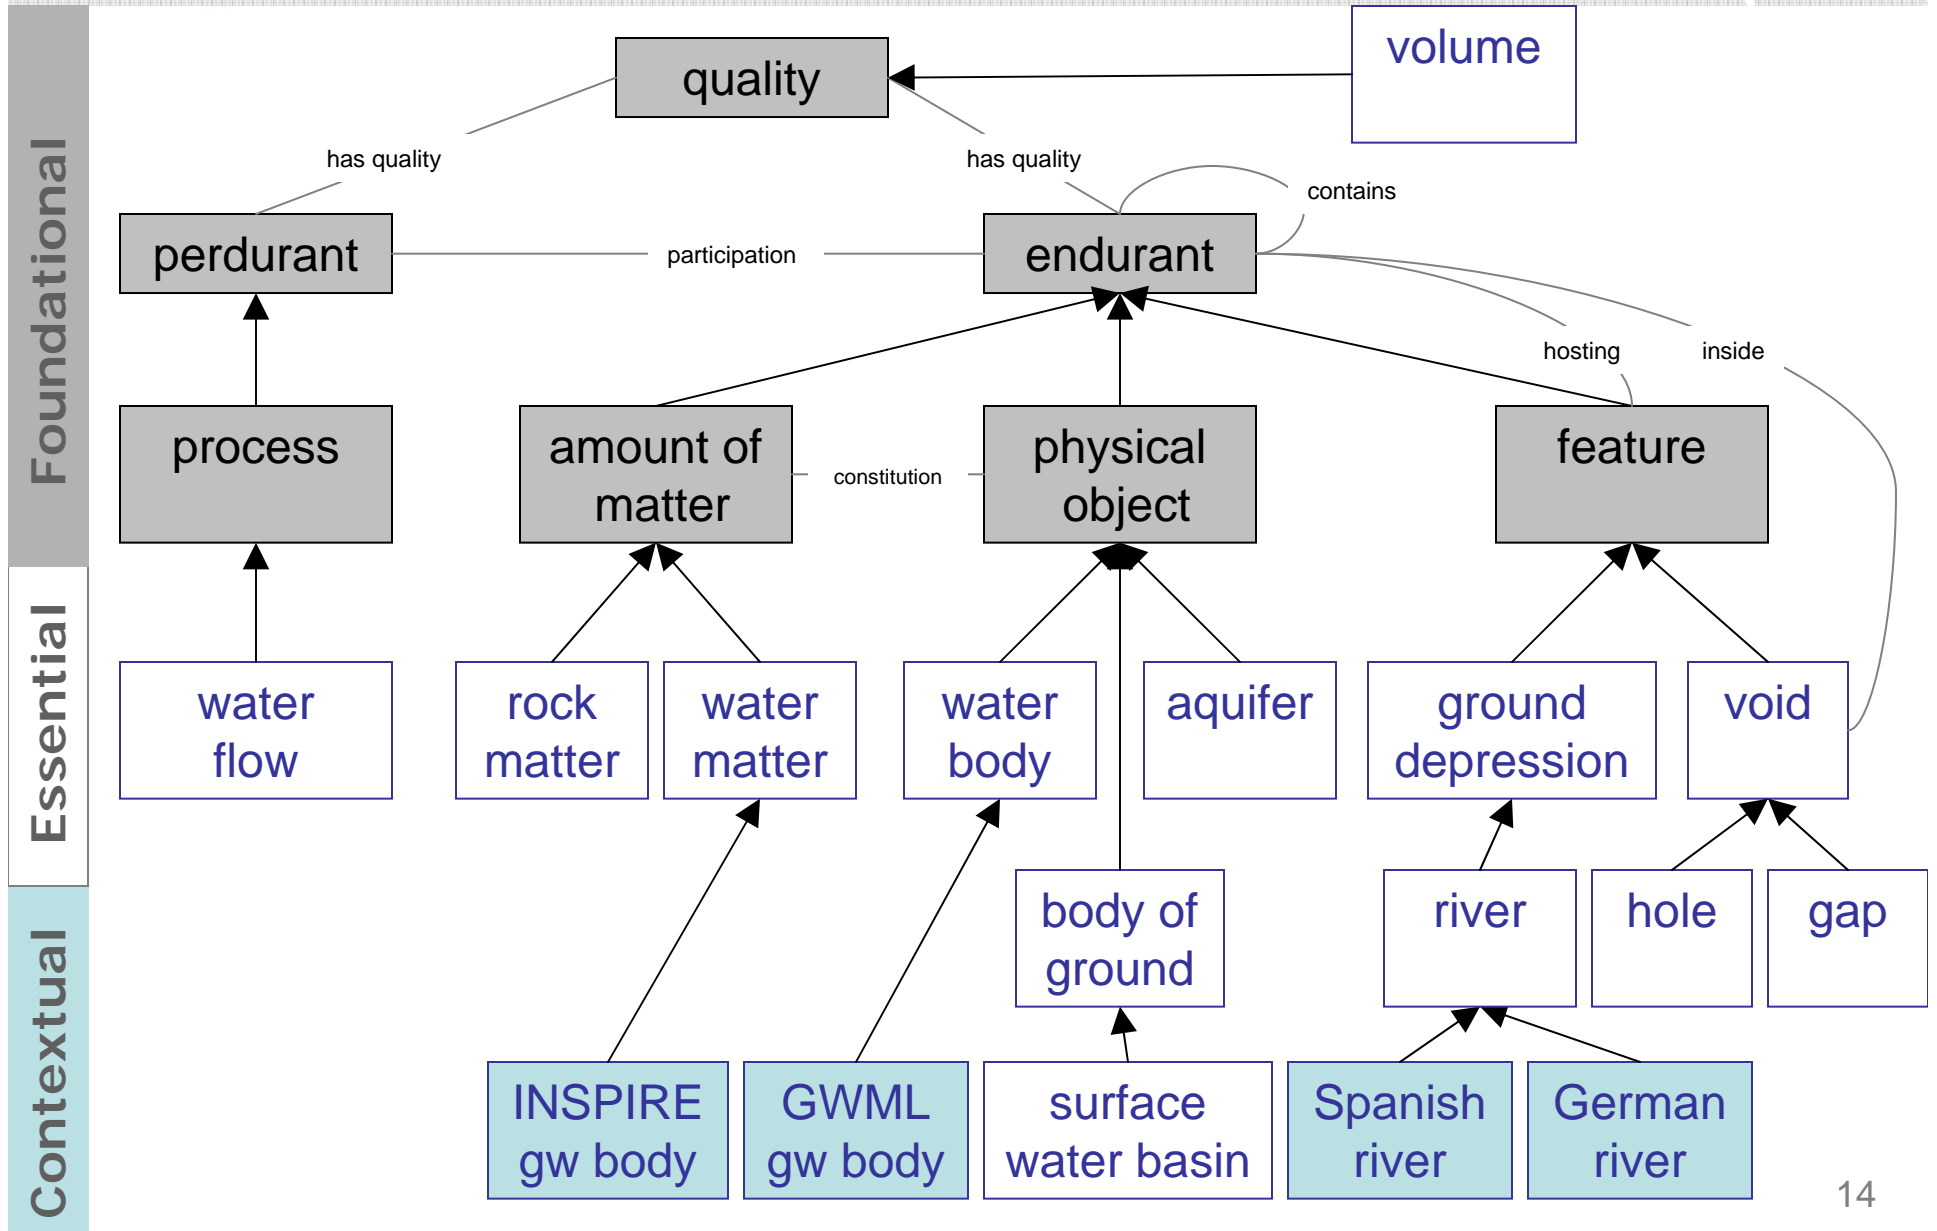

(Gap-D) $Gap(y) \equiv \exists x[hosts-g(x, y)]$

(gap has a scattered host)

(V-T2) $V_S(x) \leftrightarrow Gap(x) \vee Hole(x)$ (gap and hole exhaustive classes of simple voids)

Tiered hydro ontology

Conclusions

- **progress on reference hydro ontology that integrates surface and groundwater entities**
- **includes expanded ontology of voids and some topological relations**
- **foundational and essential domain ontologies can help:**
 - disambiguate conceptual differences in emerging SDI standards
 - inform SDI data standards design

Thank you!
