Aligning NASA SWEET sciUnits Ontology with COSMO

First Look at Prefixes June 2009 Patrick Cassidy

NASA SWEET Units Ontology

 Uploaded to the OOR repository: http://oor-01.cim3.net/ontologies
 Name of original file in OOR "SWEETunits"

Modified file: SWEETunits_Mod1

- 47 owl:Classes
- 25 Object Properties
- **16 Datatype Properties**

91 instance of unit (11 Base, 35 Complex, 44 derived (as by scaling with prefixes)

Units Ontology without Math

10 owl:Classes (was 47)5 Object Properties (25)6 Datatype Properties (16)

91 instance of unit (11 Base, 35 Complex, 44 derived (as by scaling with prefixes)

 SciUnits002 Protégé 3.4 (file:\C:\pc\ontolog\UnitsOfMeasure\Merge\sciUnits002.pprj, OWL / RDF Files)

Prefix representation

- sciUnits: 'Prefix' is a top-level class (type), intended as specific for units of measure
 - milli, micro, centi.kilo, etc.

COSMO:

distinguishes AbstractString from datatype String. Related by :

AbstractString – hasStringDatatype - &xsd;string

As an AbstractString, a generic "Prefix" may be a prefix for any kind of word. The subtype 'UOMprefix' is specifically a prefix for Units of Measure, but still a first-class ontological type (owl:Class), not a datatype.

Representation of Prefixes in COSMO

- Why represent a prefix as a first-class entity rather than as a datatype string?
 - So that the entity can be given a meaning
 - e.g. that 'milli' represents 1/1000
 (not just that millimeter is 1/000 of a meter)
 - In SUMO, a UOM prefix is represented as a function
 - In COSMO UOMprefix is an type of string (owl:Class):
 - •
 - Tuple

List

AbstractString Prefix UOMprefix

Representation Of Units of Measure in COSMO

- UOM is a subtype of 'AttributeValue'
- AttributeValue
- QuantitativeAttributeValue
- MeasurableQuantity
- PhysicalQuantity
- UnitOfMeasure

Symbols and Abbreviations

- In sciUnits the datatype relation 'hasSymbol' relates a Unit or Prefix to its abbreviated symbol; e.g. {'kilo' hasSymbol "k"}
- But the string "kilo" itself is a symbol of the Prefix 'kilo'

 the distinction between the labels for ontology
 elements and the lexical strings that symbolize them is
 not explicitly accommodated in sciUnits.
- Recommendation:

Distinguish a generic 'hasSymbol' for pointer to lexical strings, and 'hasAbbreviation' for pointers to abbreviations.

Concatenations

For a human-level understanding of the way scaled units (kilo-meter) are composed of Prefix and BaseUnit, a string concatenation function is needed.

Generally, arithmetic as well as string manipulation are required for proper understanding of units. These must be implemented procedurally, and therefore some arrangement within the ontology must be included for agreement on procedural implementation issues.

Parting Thoughts

- A 'Units of Measure' ontology deals with issues that are well-understood and widely agreed on. Nevertheless ontological representation rapidly reaches a point where consideration of procedural implementation is necessary (scaling, symbol concatenation).
- It will be best to identify an open application that can use a Units of Measure ontology, and develop the ontology with that application as a test bed.

NIST UnitsML

- http://unitsml.nist.gov/
- Described in xsd file:
 - http://unitsml.nist.gov/Schema/unitsmlSchema-0.9.17.xsd
